Jamie Lewis
Wats 3020: Intro to JavaScript
Final Project Design Plan
April 21, 2017

The concept of the site I will be designing will be a product page for the Canon EOS- 1D X mark II. This will share the features, specs, visuals of the camera and a link to Canon's website and social media. I will also use photos that have been taken with a 1D to help to show the ability of the camera and add a pop to the page. There will also be reviews of the product which might include linked articles of review on the product.

The site will be sleek and mostly grayscale with the use of color in the Canon logo (red) and the visual pop of the photos taken by the 1D. The overall appearance will be clean and stylize to fit the sleekness of the camera. In terms of content I will get most of the information will come from the Canon website, photos will come from AdobeStock and reviews will come from Canon and online photographer reviewers.

In terms of the abilities of the website I want it to be easy for the user to use, I want it to have a clean navigation bar that will take the user to different parts of the websites from the top, as well as the ability to go back up with a top back arrow. I want the site to scroll seamlessly as one nice page. I want the areas of each side to have some information but possibly the ability to hide details if there is to much to display all at once. I think there could some sort of pop message, but I haven't completely flushed that idea all the way out. There will be a carousel that will be running with photos with a smooth transition between each to add not detract from the website.

2. The third party libraries I'll be using are as follows:

> jQuery
> Bootstrap
> Some font library (haven't figured out exactly which one)
> Possibly a photo viewing app (not sure of which one yet)

And I'm sure there will be more libraries I could use. There is a quite a lot out there so it is taking some time to invest and weed out what would be helpful.
